Powerful, Unique Ejector Pin Grease from Slide Products

Wheeling, IL, October 2024 – When it comes to proper lubrication of ejector pins and other mold components, all high temperature greases were *not* created equal. Moving components within the mold have tight tolerances for optimum performance. Attempting to combat a gumming issue quickly with an inferior or generic greasing spray may provide temporary relief but could eventually create sticky parts and potentially cause considerable downtime.

When servicing a poorly greased mold it's critical to use the correct product as soon as possible. It's also important to note that mixing different compounds (such as a petroleum-based versus synthetic) can exacerbate problems.

Slide's clear, high-temperature [Super Grease](#) is a unique formulation and an essential remedy in fighting contamination, discoloration of parts and helping avoid premature replacement of molds/machines. Thixotropic properties offer excellent stability during sudden temperature changes. The paintable, clear, non-yellowing formula is ideal for medical and food grade plastic parts – Super Grease is NSF certified in such environments.

Slide factory rep Jeff Lewis recalls an unpleasant situation that occurred where a machine became unstable due to inadequate lubrication and took five hours to resolve. It had been shipped without being properly lubricated and then seized up when started:

“I remember having to sit on the floor for hours with a polishing stone, straightening and re-polishing the pins just to ensure the machine would be ready and available for production in the morning.”

Super Grease holds real-time benefits across multiple molding and mold making daily challenges. It contains PTFE with no silicones and will not bleed out. The product is available in aerosol and non-aerosol choices that include 3-oz. tubes, 14-oz. tubes, 7-lb. cans, 35-lb. cans and 400-lb. drums. Free samples and on-site assessments are offered for most of Slide's products.
